Telecom Care Agent

COPILOT STUDIO · POWER AUTOMATE · DATAVERSE · GPT-4.1 MINI · MICROSOFT TEAMS

An AI-powered internal tool for telecom customer care agents, deployed to Microsoft Teams. The agent handles real-time product recommendation and AI-summarised customer interaction history, built entirely on the Microsoft Power Platform with no custom code.

The Problem

Customer care agents in telecoms spend valuable time switching between systems, manually searching product catalogues and scrolling through call logs, while customers wait on the line.

The Challenge

Agents need to simultaneously understand a customer's requirements and match them against an ever-changing product catalogue. They also need rapid access to a customer's recent interaction history before any meaningful conversation can begin. Neither task is fast enough in existing tooling.

The Solution

A single Teams-based AI assistant that handles both tasks through natural language. Agents describe requirements in plain English; the assistant finds the right plan. They ask for a customer history by phone number; the assistant retrieves, summarises and presents it in seconds.

CORE CAPABILITIES	LINES OF CUSTOM CODE	PA FLOW STEPS	DEPLOYMENT CHANNEL

KEY FEATURES

- Natural language routing
- No menu navigation
- Consistent summary format
- Empty-state handling
- Phone number extraction

Step by Step

Two capabilities, one assistant. The agent routes automatically based on what the care agent asks. No buttons, no menus.

01

AGENT SENDS A MESSAGE IN TEAMS

The care agent types a natural language request — either describing a customer's data, budget and roaming requirements, or asking for recent interactions with a phone number.

02

GENERATIVE ORCHESTRATION ROUTES THE REQUEST

Copilot Studio's generative orchestration reads the message and determines which capability to invoke — Product Recommendation or Customer Interaction Summary — without any rigid menu topic.

03

CAPABILITY A — PRODUCT RECOMMENDATION

The agent searches the Dataverse Product knowledge source, reading each plan's description field for roaming, data type and contract terms, then returns up to 3 ranked matches with plan name, price, data allowance, type and fit reason.

04

CAPABILITY B — POWER AUTOMATE RETRIEVES CALL RECORDS

The Customer Interaction Summary topic triggers a Power Automate flow. The flow looks up the contact by mobile number, fetches the 5 most recent phone call records, then uses Select + Join to flatten the JSON into a clean pipe-delimited string.

05

GPT-4.1 MINI SUMMARISES THE INTERACTIONS

The flattened string is passed to a Copilot Studio Custom Prompt powered by GPT-4.1 mini. The model returns a structured summary: one dated bullet per interaction with subject and outcome, plus a closing status line.

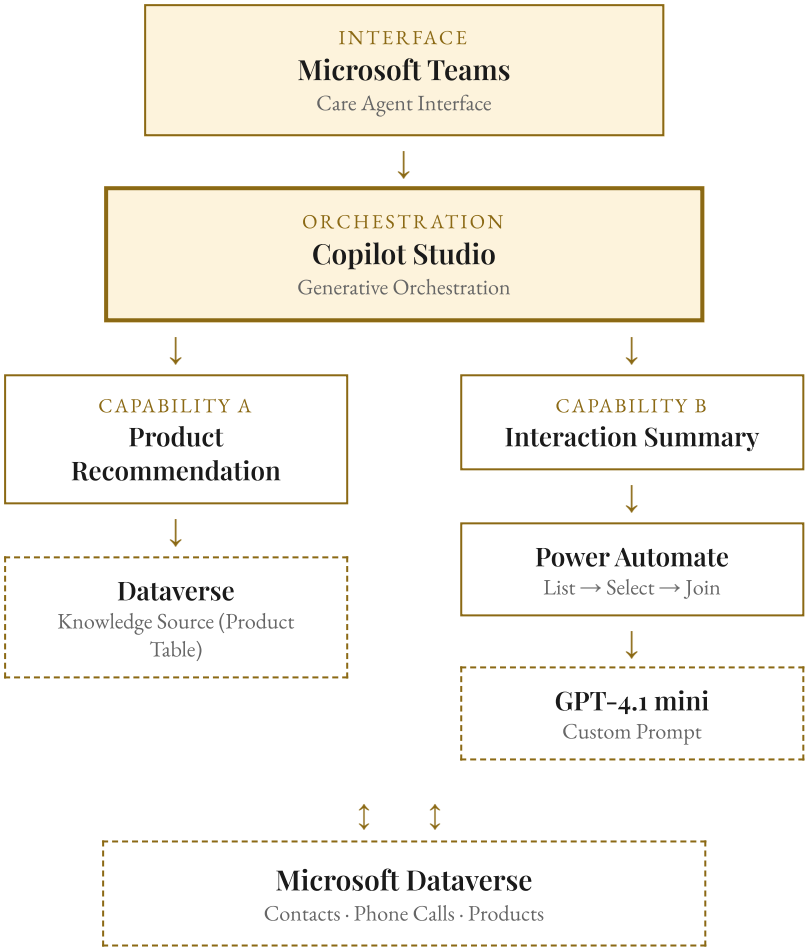

06

FORMATTED RESPONSE DELIVERED IN TEAMS

The agent receives a clean, consistent output directly in Microsoft Teams — product recommendations ranked by fit, or an interaction summary in a predictable format every time.

System Design

Built entirely on the Microsoft Power Platform. No custom backend, no external APIs. All capabilities are wired together through native platform connectors.

Capability A — Product Recommendation

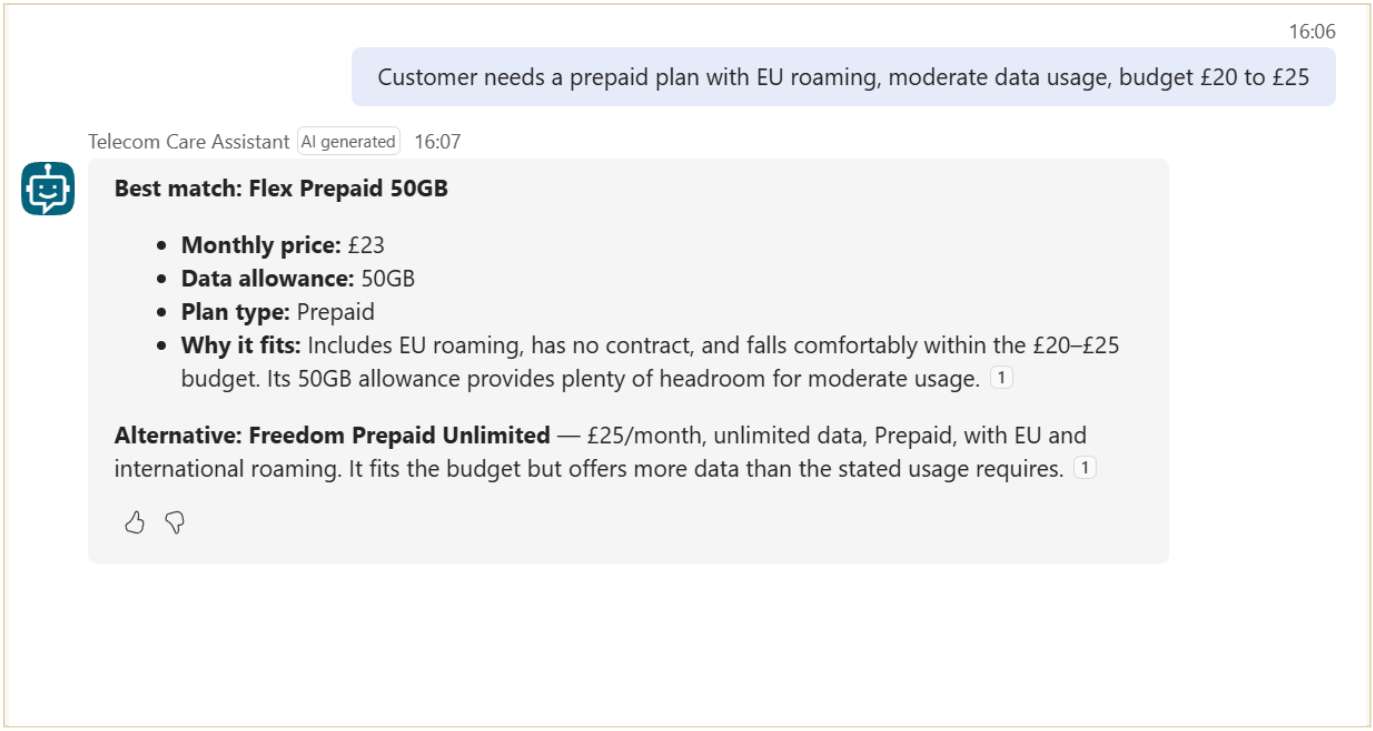

Dataverse is connected as a knowledge source. Copilot Studio performs semantic search over the Product table using the description field as the primary matching signal. No flow required — the agent queries directly.

Capability B — Interaction Summary

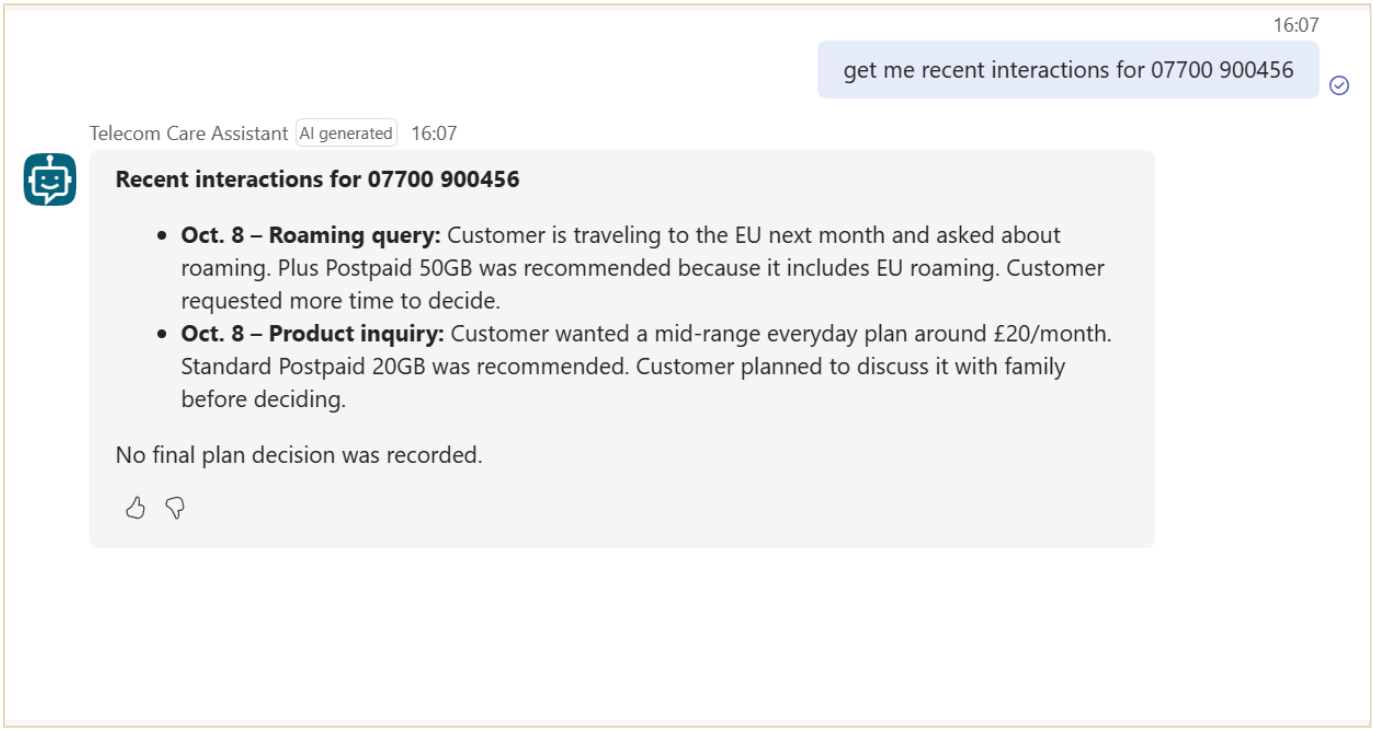

A Power Automate flow queries Contacts by mobile number then retrieves the top 5 Phone Calls records sorted by date. Select and Join flatten the JSON, which GPT-4.1 mini then summarises into a fixed bullet format.

Agent in Teams

Both capabilities tested end-to-end in Microsoft Teams, with real Dataverse data. Results are consistent, concise and professional.

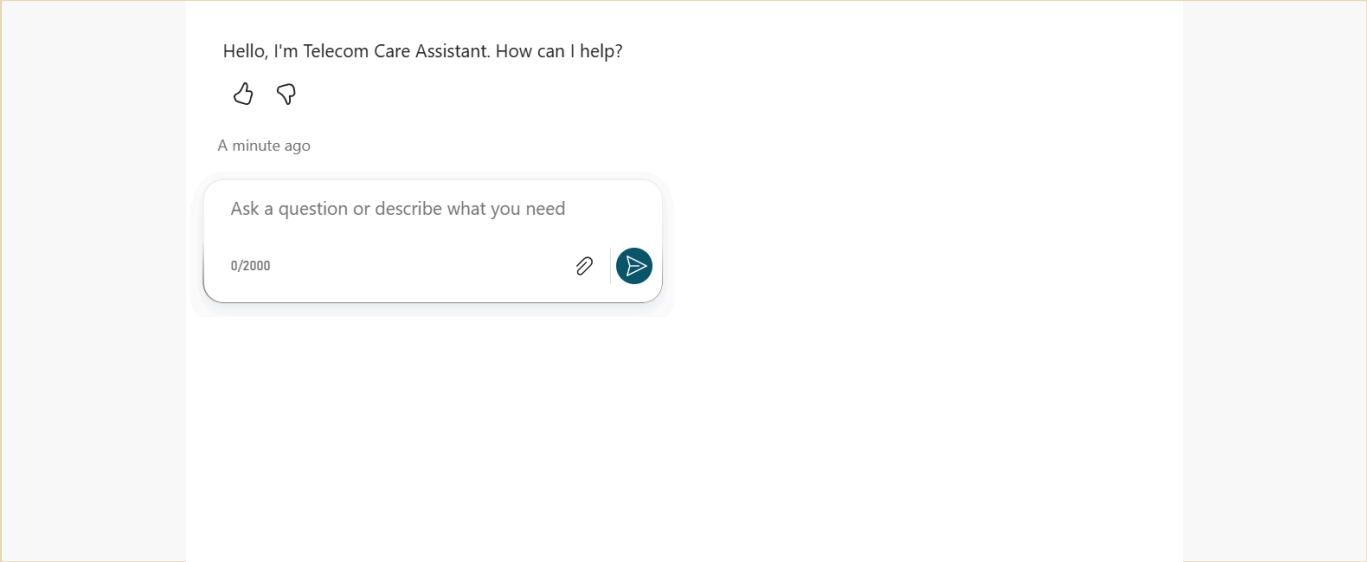

Product recommendation — Flex Prepaid 50GB returned as best match for 50GB, EU roaming, budget under £25

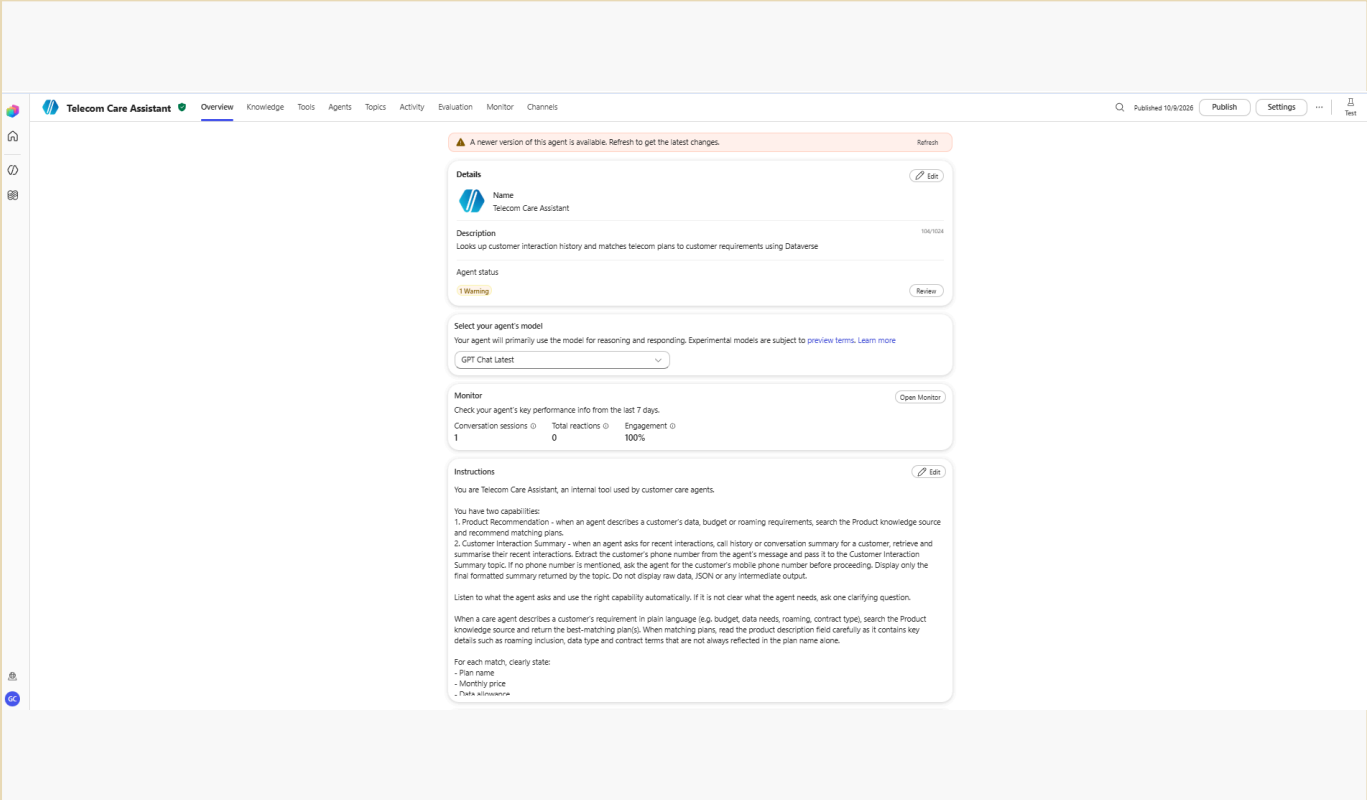

Customer interaction summary — dated bullet format with closing status line, generated by GPT-4.1 mini

Agent & Studio Views

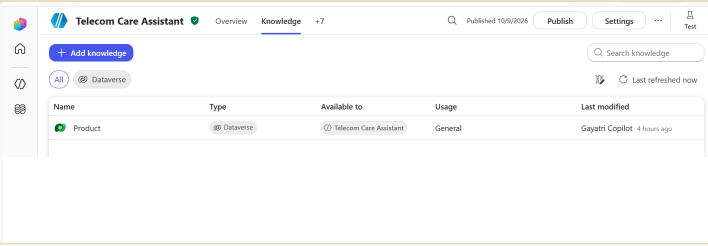

Agent greeting in Teams — "Hello, I'm Telecom Care Assistant. How can I help?"

Components

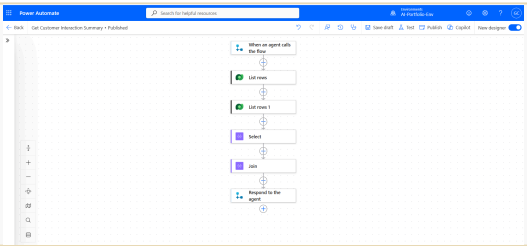

COMPONENT	TECHNOLOGY	ROLE
AI Agent	Microsoft Copilot Studio	Hosts the assistant, manages generative orchestration, topics and custom prompts
Orchestration	Generative Orchestration	Routes natural language requests to the correct capability automatically
Automation	Power Automate	Retrieves and flattens Dataverse phone call records for summarisation
Data Store	Microsoft Dataverse	Stores Product catalogue, Phone Calls and Contacts tables
Summarisation	GPT-4.1 mini / Custom Prompt	Produces consistent dated-bullet interaction summaries from raw call data
Deployment	Microsoft Teams	Care agent-facing channel, no additional infrastructure required
Environment	Power Platform	AI-Portfolio-Env managed environment hosting all platform resources

Dataverse Product table connected as knowledge source

Custom Prompt — Summarise Customer Interactions (GPT-4.1 mini)

Power Automate flow — List rows (Contacts) → List rows 1 (Phone Calls) → Select → Join → Respond to agent

Key Design Decisions

- Generative orchestration replaces rigid menu topics; agents use natural language throughout
- Select + Join flatten JSON before GPT summarisation, keeping prompts clean and output consistent
- Description field is the source of truth for product matching, not plan name alone
- Fixed custom prompt format ensures the same output structure on every call

Future Enhancements

- Add plan upgrade/downgrade recommendation based on current subscription
- Integrate with ticketing system to create cases directly from Teams
- Extend interaction history to include chat and email channels
- Add sentiment analysis to flag at-risk customers automatically
